Version 0.1

Abstract

to be written...

Contents

1 Introduction 1

2 Implementation in gretl 1

3 Usage of the package 2

4 Examples 2

Changelog

0.1 Initial version.

To do

1. crucial:
   - where should we use glib types?
   - parameters naming schema: we need to set up some things (for example: `"print"` or `"do_print"`)
   - do we allow passing a regular command/script and execute it?
2. important:
   - do **libgretl** bindings (like `"do_arma()""`) stay in gretl_calls.cpp or we place them in additional source (like "gretl_bindings.cpp")?
   - directory structure (including resulting binaries)
   - can we automatically guess data periodicity (vide `DSET["periodicity"] = "4"`)
   - do we want to bundle some pure Python code as well (f.e. for translating Pandas dat-frame to dict)?

1 Introduction

We introduce gretl4py package...

2 Implementation in gretl

In this section, we will describe the basic idea of the package.

3 Usage of the package

At first...

4 Examples

The demo directory includes...
